Identification

Emendation of BF.2.20 (Data Base and Transaction Block Discipline for Outer Modules).
J. F. Ossanna

Emendation

In order to conform to actual implementation, the specification of the tbm\$thread and tbm\$unthread calls should be as follows.

```
call tbm$thread(tbindex2,tbindex1,cstatus);  
call tbm$unthread(tbindex2,tbindex1,cstatus);  
  
declare  
    tbindex2 bit (18), /*index of block basing the  
                       down chain*/  
    tbindex1 bit (18), /*index of block to be  
                       (un)threaded*/  
    cstatus bit (18); /*thread call status*/
```

The only change is the inversion of the order of tbindex1 and tbindex2 in the calling sequence.
