Identification

Addendum, BY.12.04
M. A. Padlipsky

p.2 Insert the following paragraph before Implementation:

Note

The condition-handling mechanism is predicated upon the assumption that users will remove (i.e., call reversion for; see BY.12.05) condition-handlers which have been established in a given procedure by the time that procedure returns. If handlers are not so removed, there is a possibility that they will be erroneously invoked at some later point in the process when the establishing procedure is itself no longer active (i.e., has no Stack frame). By and large, invocation of a handler in such circumstances would be meaningless, although doubtless a perspicacious student of BD.9.04 could invent ways of taking advantage of the situation.
